

Thank you for purchasing the Axner Soup, a glaze additive.

### Instructions for Axner Soup:

- One of the applications of Axner Soup is to increase the strength and durability of glazes and slips. When added to a dipping glaze in amounts of 5%-15% (depending on the glaze), the glaze will take on a brushing consistency. When adding multiple layers to a pot, the soup will act as a barrier so that glazes do not wipe off with a second or third coat of glaze. The thickness and smoothness of the glaze is increased without any degradation of the original color. Also, the glaze is less likely to flake off or smudge before firing the work.
- For slips, add roughly the same ratio, of 5%-10% for increased smoothness and flow of the slip. The Soup will not affect the color or the decorative results.
- Soup can also be added to a kiln wash for added durability and longevity.
